

iPass 3.5.4.110 for Android Release Notes

VERSION 1.0, FEBRUARY 2017

New Features and Enhancements

iPass 3.5.4.110 for Android adds the following features:

- Added connectionStatusCode to the metadata to help track unhandled connection status codes.
 - To better analyze and diagnose connection failures reported by the client, the metadata sent by the client contains the connection status code. This log service console can be used to search for the error codes reported by the client.
- New Devicescape SDK integration
 - Curates networks by uploading logs using a Devicescape API. Can call the login API even if the previous session was active. New SQM error code 18407 has been added for this case.
- Connection enhancements:
 - iOS client now performs additional internet check on certain connection failures so that successful auth failover reconnection attempts are now accurately reported. Previously, iPass client software reported connection failures even when the transaction server successfully authenticated the user. New SQM error codes are added for cases which are prefixed by "9".
- Error codes 17505 and 17255 are now fixed.

System Requirements

iPass 3.5.4 for Android has the following requirements:

- A Wi-Fi capable device running Android OS 2.3 or later.
- A screen with HVGA or higher resolution.
- Obtaining the app via the Android Market, a private market, web sites, or email.

- Users need an iPass account in order for the service to function. In addition, the user must be connected to the Internet (by Wi-Fi or 3G network) to activate.

Supported Languages

iPass is available in English, Simplified Chinese, Traditional Chinese, Dutch, French, German, Italian, Japanese, Korean, Brazilian Portuguese, Russian, Spanish, and Thai.

Resolved Issues

Issue ID	Description
OMA-1066	Google Starbucks networks initiation no longer prompting blank terms of service page.

Known Limitations

Issue ID	Description
OMA-419	On some devices—especially among several Samsung devices—the network landing page is launched automatically, without user prompt, making user experience less friendly.
OMA-370	This is an inconsistent issue: one-click activation fails on first attempt and is successful on second attempt. After clicking on the email link and downloading the client from store and client launches and doesn't proceed for activation. Its stays in "get started" wizard. Referrer code is not being passed.

Known Issues

iPass 3.5.4 for Android has the following known issues:

Issue ID	Description
116605	Occasionally, Android 4.0 devices may loop in the presence of access points with a non-effective DHCP server. When this occurs, a connection attempt can continue for up to 2 minutes while giving "Connecting" message. The user can either disconnect from the malfunctioning network or initiate a connection to another available network. Device connectivity is not disrupted during these events.
OMA-363	6.0 OS devices, if WiFi is connected to Personal network from native WiFi manager, you will be unable to switch the connection to iPass network.
